It's a nice color.

[Image] Promising review: "I've bought two pairs This isn't really surprising; the internet has expanded our product offering a dizzying amount, and we need information about the mountain of goods and services before we buy them. Reviews are an obvious solution. The problem is that a lot of those reviews are fake. And, worse, we humans are not very good at spotting which ones are real and which are bogus.

The study used a dataset of 1600 reviews of Chicago hotels. Some of them were real; others were fake. The reviews were presented to 400 subjects: each subject got eight reviews to read: a balanced set of two positive fake, two positive real, two negative fake and two negative real, presented in a random order. The reviews were written by real people who were given information about the hotel and told to work it into the review.

The results were illuminating, showing that consumers generally trust negative reviews more than positive ones. Moreover, we humans appear to have a bias towards assuming that positive reviews might be fake, Azimi says.

"Overall, negative reviews are less common than positive ones. So, that's why we pay more attention to them. So it's a totally different processing of positive versus negative information. But when a negative (review) is fake, we get fooled by it."

Many of us believe that we can spot liars. There is a world of literature and research devoted to the study of the "signals of deception": gaze avoidance, fidgeting, restless foot and leg movements and so on. There's the Paul Ekman hypothesis of facial micro-expressions as indicators of lies. There are numerous professional courses offered, claiming that they can train a person to spot a liar.

Azimi, Chan and Krasnikov's study suggests that we're no better with text than we are in person, although the liar's tools may be different when he
